Bihar political culture composed of many factors in which casteism, nepotism, religionism are main. But here we think over Bihar political culture in angle of environment. From ancient time the people of Bihar worship the nature and have relation with God Indra who has power who control nature. The god Indra, the God Agni, the god Varun, the god Pawan and the god Sun, all are power of nature and natural control. From ancient time the people of Bihar used natural ingredient in his worship and there is no availability of any artificial ingredient in this worship process. So, we Can say the, Environmental conservation for There sustainability is present in mind of people of Bihar from ancient time

In present time we saw that there are increasement in global temperature and their bad effect on our health and increasement in various type of diseases, increase of flood and drought in each and every part of world and our country. The natural balance of nature is destroyed and natural catastrophe increase day by day, the pollution increases day by day each and every segment of our nature. pollution in air, pollution in water, pollution on sea, pollution in surface of earth, the greenhouse effect of Carbon dioxide increases our Temperature of earth environment raising of sea level, gave a devastating effect on the town who is present near the sea off sore.

The industrial revolutions that were started in seventeen centuries started the process of pollution. Increase in Corbon dioxide, methene, and other greenhouse gas, spur the increase in global temperature, and this increase in temperature gave a very bad effect on balance of our nature. The plants, tree, shrub, and forest destroyed, for acquiring land for establishing industries.

The concept of environmental sustainability - First, we understand the carrying capacity of earth, that is maximum capability of earth beyond this they cannot full fill the basic natural requirement of creature of earth. The preservation of biodiversity on our earth is very important and essential for balancing each and every process on the earth. If we consume various resources of earth, then our next generation find them in trouble, So, here we understand the concept of environmental sustainability this means sustainable environment for long use and best source for our next generation. united nation passed the resolution to implement sustainable development goals on the September 2015 adopted by 193 countries of the U N general assembly. successful cop Twenty-one Paris agreement was completed in December 2015. towards the global sustainability. The discipline of social sciences promotes trans boundary research incorporating co - design

processes, facilitating engagement with and involvement of different stakeholders together with developing scientific network under science - policy interface.

Relation between Bihar political culture and environmental sustainability- From ancient time, the people of Bihar worship nature, plant and tree and their almighty Gad, also a controller of natural power. The people of Bihar have nature friendly relation. But, today, the political scenario of Bihar not include the green policy in their political policy. The central government, Bihar government gave their attention and make various law to environment from four to five decades but not fined expected result. The people of Bihar having eco-friendly culture but industrialization, pressure of increased population, used of natural resources for profit making, only profit-making minded industrialist, minimum awareness about protection of environment and above all very minimum interest of political parties a political leader in environment related matter.

Political agenda of political parties and environmental sustainability- In Bihar politics, there are many national and regional parties who active in Bihar State politics. But in time of election their political agenda not include environment related agenda and not fight election on matter of environment. They do their politics on the subject of nepotism, casteism, religionism and many other local subject and local politics.

political culture, media and environmentalism- we already saw that, there are many types national, international, regional and local newspaper and other type of media present in Bihar but when we took a look on their subject matter we find, very limited time and space for environmental subject. They do the work for local and national matter but not do the work for increasing environmentalism in common people. media have varied great impact on political culture of Bihar, but media very slow to motivate people to adopt environmentalism. Just like west media give very importance to environment related subject.

Education, political culture, and environmental sustainability- The standard of education changed the political culture. In Bihar, we saw that the education of common people raises day by day. The new concept and idea also include in political culture of Bihar. Here we think over the concept of environment, the new thinking, concept, and new idea to save the environment comes from this modernisation of political culture.

Bihar government policy to protect the environment- Bihar government made many laws related to environment. For protection of forest, water, and green plants they made many laws. Also, they made law for air pollution. They impart many restrictions on consumption of fossil fuel. they provide many concessions on use of solar and electronic bike and scooter. They also provide concession on Iridium battery and also plan to use Hydrogen fuel.

Climate justice and Bihar political culture- In future we have to include climate Justice in policy and also merge this concept in Bihar political culture so that common become beneficial from this. For zero carbon world, climate Justice requires protecting the ability of global poor to meet their needs and to develop. If green policy of Bihar adopts climate justice, then the political culture of Bihar become eco- friendly.

Environmental sustainability, Justice for future generation- Environmental sustainability provide us distributive justice and Intergenerational justice. The concept of environmental sustainability makes the future of next generation very bright. we used resources of earth generation to generation. If we made our political culture eco- friendly, we reach the aim of environmental sustainability.

From above discussion, we find that Bihar political culture include the environmental sustainability in themself and made them eco-friendly tor saving the future of next generation. in future environment factor have their impact on each and every policy of Bihar and other government. we save our earth by adopting green policy in political culture
