A REVIEW HEPATOPROTECTIVE ACTIVITY ON HERBAL DRUG IN INDIAN MEDICINE SYSTEM

Ashwini Wanve, Dr. Chakresh Patley, Dr. Rajesh Mujariya, Dr. Manjeet Singh, Punam Bihone

Institute of Pharmaceutical Science and Research (IPS), Balaghat (MP), 481331, India

Abstract:

A phototherapeutic approach is the modern drug designing and development for traditional medicinal plants. In that pure phytochemicals as drugs is time consuming and expensive. Liver disease is one of the major causes of morbidity and mortality across the world. According to WHO estimates, about 500 million people are living with chronic hepatitis infections. Liver is a most important organ of the body. It plays an important role to maintaining various physiological processes in the body. It is involved in several vital functions, such as metabolism, excretion and storage. It plays a central role in the detoxification and excretion of many exogenous and endogenous compounds. Hence, any injury or impairment of its function has grave implications for the health of the affected person. Many more drugs or therapies are available for the treatment of hepatic disorders, but still there is a need for the novel drug discovery which can target multiple disease pathways. In the 21st century has a great that paradigm shift towards therapeutic evaluation of herbal products. The use of herbal products has a great role in the treatment of liver diseases and has no side effects.

Keywords: Hepatotoxicity, Hepato protective herbs, Siddha medicine in liver morbidity.

Introduction

Medicinal plants play a key role in the human health care. About 80% of the world population rely on the use of traditional medicine which is predominantly based on plant materials.\(^1\) The traditional medicine refers to a broad range of ancient natural health care practices including folk/tribal practices as well as Ayurveda, Siddha, Amchi and Unani. These medical practices originated from time immemorial and developed gradually, to a large extent, by relying or based on practical experiences without significant references to modern scientific principles. \(^2\) Liver is considered to be one of the most vital organs that functions as a centre of metabolism of nutrients such as carbohydrates, proteins and lipids and excretion of waste metabolites. Additionally, it is also handling the metabolism and excretion of drugs and other xenobiotic from the body thereby providing protection against
foreign substances by detoxifying and eliminating them. The bile secreted by the liver has, among other things, plays an important role in digestion. Liver cell injury caused by various toxicants such as certain chemotherapeutic agents, carbon tetrachloride-ride, thioacetamide etc., chronic alcohol consumption and microbes is well-studied. Enhanced lipid peroxidation during metabolism of ethanol may result in development of hepatitis leading to cirrhosis. It is estimated that about 7,500 plants are used in local health traditions in, mostly, rural and tribal villages of India. Out of these, the real medicinal value of over 4,000 plants is either little known or hitherto unknown to the mainstream population. The classical systems of medicine such as Ayurveda, Siddha, and Tibetan use about 1,200 plants. A detailed investigation and documentation of plants used in local health traditions and pharmacological evaluation of these plants and their taxonomical relatives can lead to the development of invaluable plant drugs for many dreaded diseases. Random screening of plants has not proved economically effective. The treatment options for common liver diseases are limited due to the lack of hepatoprotective drugs in allopathic medicine. Moreover therapies developed along the principle of western medicine are often limited in efficacy, carry the risk of adverse effects, and are often too costly, especially for the habitants of developing world. For example, the effectiveness of treatments such as those using corticosteroids and interferon is inconsistent, carried the risk of adverse events, and is often too costly. On the other hand plant derived compounds are easily accessible and affordable. There is a deep belief that herbal remedies symbolize safety because they are “natural” and fit into the image of a gentle and, therefore, harmless alternative to synthetic drugs.

More than 900 drugs & toxins have been reported to cause liver injury. Though liver has its capacity to regenerate its tissues. The updated data confirmed that hepatotoxicity was the most commonly reported adverse drug reaction leading to drug withdrawal worldwide. Paradigm shift in search of hepatoprotectives drug moiety tracing back to ethno pharmacological background offers great scope. This review article throws light upon hepatoprotectives used in Indian system of medicine.

**Hepatoprotectives herbs**

Herbal-based therapeutics for liver disorders has been in use in India for a long time and has been popularized world over by leading pharmaceuticals. Despite the significant popularity of several herbal medicines in general, and for liver diseases in particular, they are still unacceptable treatment modalities for liver dis-eases. The limiting factors that contribute to this eventuality are (i) lack of standardization of the herbal drugs; (ii) lack of identification of active ingredient(s)/principle(s); (iii) lack of randomized controlled clinical trials (RCTs), and (iv) lack of toxicological evaluation. The use of natural remedies for the treatment of liver diseases has a long history, starting with the Ayurveda treatment, and extending to the Chinese, European and other systems of traditional medicines.
Silybum marianum

The protective effects of polyphenolic extracts of Sily-bum marianum and Cichorium intybus on thioaceta-mide-induced hepatotoxicity in rat was investigated. The extracts were injected to the rats, at a dose of 25 mg kg-1 body weight together with thioacetamide at a dose of 50 mg kg body weight. Significant decrease in the activity of aminotransferases, alkaline phosphatase and bilirubin was observed in the groups treated with extracts and thioacetamide compared with the group that was treated only with thioacetamide. The level of Na+, K+ and liver weight between different groups was not significantly altered. This findings suggested the hepatoprotective effect of Silybum marianum and Cichorium intybus extracts on liver cells due to the presence of flavonoids and their antioxidant effects.

Coccinia grandis

Alcoholic extract of the fruits of Coccinia grandis Linn (Curcubitaceae) was evaluated in CCl4-induced hepatoxicity in rats and levels of AST, ALT, ALP, total proteins, total and direct bilirubin were evaluated. At a dose level of 250 mg/kg, the alcoholic extract significantly (p<0.05) decreased the activities of serum en-zymes (AST, ALT and ALP) and bilirubin which were comparable to that of silymarin revealing its hepato-protective effect.

Ficus carica

The methanolic extract of the leaves of Ficus carica Linn. (Moraceae) was evaluated for hepatoprotective activity in CCl4-induced liver damaged rats. The extract at an oral dose of 500 mg/kg exhibited a significant protective effect reflected by lowering the serum levels of AST, ALT, total serum bilirubin, and malondialdehyde equivalent, an index of lipid peroxidation of the liver.

Lepidium sativum

The role hepatoprotective of methanolic extract of Lepidium sativum at a dose of 200 and 400 mg/kg was investigated in CCl4-induced liver injury was evaluated rats using essential marker biochemical parameters. Significant reduction in all biochemical parameters were found in groups treated with Lepidium sativum. The severe fatty changes in the livers of rats caused by CCl4 were insignificant in the Lepidium sativum treated groups.

Aegle marmelos

Aegle marmelos leaves (Bael, family of Rutaceae) which is also called as Bilva in ancient Sanskrit, was used as herbal drug in the Indian System of medicine. The hepatoprotective effect of Aegle marmelos in alcoholl-induced liver injury was evaluated rats using essential marker biochemical parameters. The results indicated that, the Bael leaves have excellent hepatoprotective effect. Similar findings were also reported by other workers.
**Solanum nigrum**

The effects of *Solanum nigrum* extract (SNE) was evaluated on thioacetamide (TAA)-induced liver fibrosis in mice. Mice in the three TAA groups were treated daily with distilled water and SNE (0.2 or 1.0 g/kg) via gavage throughout the experimental period. SNE reduced the hepatic hydroxyproline and α-smooth muscle actin protein levels in TAA-treated mice. SNE inhibited TAA-induced collagen (α1)(I), transforming growth factor-β1 (TGF-β1) and mRNA levels in the liver. Histological examination also confirmed that SNE reduced the degree of fibrosis caused by TAA treatment. Oral administration of SNE significantly reduces TAA-induced hepatic fibrosis in mice, probably through the reduction of TGF-β1 secretion.

**S. chinensis (Turcz.) Baill**

*S. chinensis* (Turcz.) Baill is widely used in traditional and modern Chinese medicine for the treatment of many disorders including insomnia, respiratory failure, and weakness. Moreover, mental health improving ability along with fatigue reduction property is also validated for *S. chinensis* in Russian medicine. In general, dibenzocyclooctadiene lignans found in *S. chinensis* are known to exhibit potent hepatoprotective activity. In one of the study of individual lignin, Gomisin A was found responsible for the acceleration of hepatocytes proliferation and increase hepatic flow. Furthermore, elevation of mitochondrial glutathione concentration was found to be linked with γ-schisandrin hepatoprotective mechanism. The increase in vitamin C concentration in the liver of test animals upon treatment with γ-schisandrin also validates its hepatoprotective ability. Another individual lignin, Schisandrin B was also found to counter oxidative harm to liver tissues. In one scientific study, the hepatoprotective mechanism against acetaminophen-induced liver injury of six Schisandra lignans (deoxyschisandrin, Schisantherin A, Schisandrin B, Gomisin A, Schisandrin C, and schisandrin) was elucidated. The hepatoprotective ability of these lignins was found to be associated with inhibition of cytochrome-mediated bioactivation. Furthermore, another mechanistic study investigated the hepatoprotective effect of Schisandra polysaccharide in nonalcoholic fatty liver disease mice models. The results demonstrate potential down regulation of hepatic lipogenesis genes and LXRα/SREBP-1c/ FAS/ACC and SREBP-2/HMGCR signaling pathways in the liver.

**C. chinensis Lam.**

*C. chinensis* Lam. also known as Chinese dodder is a parasitic plant having diverse traditional medicinal uses as a tonic, sex enhancer, and abortion preventer. Studies also have scientifically validated the hepatoprotective activity of *C. chinensis* evaluated the hepatoprotective effect of *C. chinensis* ethanol solution extract in rats with the acetaminophen-induced toxicity of liver. The elevated concentration of glutamate oxaloacetate transaminase, glutamate pyruvate transaminase, and alkaline phosphatase was reduced significantly via treatment of rats with 125 and 250 mg/kg of *C. chinensis* ethanol extract orally. Furthermore, it was found that the ethanol solution extract prevented centrilobular hepatic necrosis and acetaminophen-induced toxicity of liver. The ethanol solution
extract was further found to also elevate the level of potential antioxidant enzymes like glutathione peroxidase, superoxide dismutase, and catalase.\textsuperscript{[23]} In another study by the same group, nanoparticles formulation of C. chinensis seeds ethanol solution extract was found to be more effective in rats with acetaminophen-induced hepatotoxicity. The mechanism of hepatoprotective potential as demonstrated by ethanol solution extract of C. chinensis is proposed to be the elevated activities of antioxidant enzymes.\textsuperscript{[24]}

\textbf{L. barbarum L}

L. barbarum L. berries are very famous in traditional Chinese medicine for the treatment of inflammation, cancer, eye disorders, throat infection, and anemia.\textsuperscript{[25]} The use of these berries has been validated as food and also has gained great importance due to its significant antioxidant potential. The major active components of L. barbarum berries are L.barbarum polysaccharides (LBPs) which are reported widely to have diverse pharmacological properties. In a study, the hepatoprotective effect of LBPs in rats having alcohol-induced liver injury has been validated. Liver injury model was made via treatment of ethanol, which exhibited elevated levels of liver enzymes and fatty liver. Upon treatment of L. barbarum polysaccharides for 30 days in a dosage of 300 mg/kg, the liver injury model revealed prevention of fatty liver and minimized liver injury Diels A. sinensis (Oliv.) Diels is reported in Chinese herbal medicine for the treatment of cardiovascular disease, anemia, and hepatic disorders.\textsuperscript{[26]} The A. sinensis polysaccharides (ASP) extracted from A. sinensis roots having the average molecular weight of 72,900 Da is regarded as a potential active component of A. sinensis that exhibits a wide range of pharmacognostic properties. The hepatoprotective potential of ASP in CCl4-induced liver injury and via using ischemia/reperfusion rat is widely established have investigated the hepatoprotectives mechanism of ASP against Concanavalin A-induced failure of the liver. It was found that 5 to 125 μg/mL of ASP has inhibited the Concanavalin A-induced responses. Major reduction in the levels of serum transaminase was seen, whereas Hematoxylin and Eosin staining reported liver inflammation attenuation. The study concluded that pretreatment of ASP elicits antiinflammatory and antioxidant actions, which attenuates Concanavalin A-induced liver injury. In another study, Zhao et al., investigated the role of A. sinensis derived Levistilide A against CCl4-induced liver fibrosis. The results validated the potential role of Levistilide A in liver fibrosis inhibition via antiangiogenesis

Methodology

A list of hepatoprotective plants used in Indian Arabia was prepared based on a nationwide survey of herbal drug used in traditional medicine for liver ailment by\(^\text{[28]}\)

(a) interviewing the patients visiting primary care centers of military hospitals of different regions of Indian Arabia,

(b) review of traditional medicinal books/publications and folklore information. Thorough survey of literature on the pharmacological profile of these plants was undertaken to collect the published data for the period between 1975 and 2014 AD by using “Pubmed” and “Google Scholar” search engines.\(^\text{[29]}\) Attempt was made to determine if these plants have been tested for hepatoprotective activity using well-established experimental models including carbon tetrachloride (CCl4), thioacetamide, paracetamol, ethanol, and morphine induced liver damage.

The liver enzymes including aspartate transaminase (AST),\(^\text{[30]}\) alanine transaminase (ALT), alkaline phosphatase (APT), total protein (TP),\(^\text{[31]}\) and albumin (Alb) were used as a marker of liver injury. Literature search also included reversal of toxin induced histopathological changes by plant drugs. An attempt has been made to illustrate possible mechanism of hepatoprotective herbs with special reference to their antioxidant and inflammatory mediators.\(^\text{[32]}\) Available data about the chemical constituent of the hepatoprotective plants and their toxicity has also been presented. Briefly, this review summarises the information about 35 hepatoprotective herbal drugs used in Indian traditional medicine for the treatment of liver diseases including their botanical name, family, and part of the plant used, distribution of plants in Indian Arabia, and their use in traditional medicine.\(^\text{[33]}\) The results of hepatoprotective studies on each plant, possible mechanism of action, and their chemical composition and toxicity data have been presented.

CONCLUSIONS

Hepatoprotective plants clearly indicate that herbal drugs have an enormous potential for the treatment of liver diseases. In this article, we reviewed the scientific merit of selected plants studied for their hepatoprotectives mechanism of action. The major hepatoprotectives mechanism identified by the majority of the studies is through combating the oxidative stress that damages the liver therefore, we conclude that herbs and herbal preparations are among the most important sources of hepatoprotectives and liver regeneration medicines. However, further research is needed to identify, characterize, and standardize the active ingredients, useful compounds, and their preparations for the treatment of liver diseases. Moreover, a combination of the traditional herbal medicines with the modern and conventional medicine may be one of the best options for the treatment of liver disorders and other diseases and infections, soon.
Future Prospects

About 80% of the world's population fulfills their healthcare needs from medicinal plants. There has been a significant rise in using over-the-counter medicinal plant products containing powerful medicinal drugs and are believed to have to produce progressive effects with reduced side effects. However, therapeutic failures or adverse effects have been observed in many cases as pharmacological mechanisms of the herbal mixtures / preparations are not well studied.
