EFFECT OF SELECTED YOGASANAS ON DIABETES AMONG DEGREE COLLEGE MEN LECTURERS OF NARASARAO PET

1 Y.Madhusudhana Rao
1 Lecturer in Physical Education, SS&N College, Narasarao Pet, India

Abstract:

The purpose of this study is to analyze the effect of selected yogasanas on diabetes among degree college men lecturers of Narasarao Pet. Hence 40 subjects were randomly selected whose age range between 35 to 50 years and based on their mean random blood sugar level grouped into two, control group and experimental group. Pre tests were conducted for all the subjects on selected physiological and biochemical variables such as systolic blood pressure, diastolic blood pressure, postprandial blood glucose and fasting blood sugar. The experimental group underwent yogasanas for twelve weeks. After the experimental period, the post tests were conducted on the same dependent variables. The difference between initial and final scores was considered as the effect of respective treatment. To test statistical significance, ANCOVA was used. In all cases 0.05 level was fixed to test the hypothesis of this study.

Key Words: systolic blood pressure, diastolic blood pressure, postprandial blood glucose and fasting blood sugar

I. INTRODUCTION

Diabetes was the ninth leading cause of death with an estimated 1.5 million deaths directly caused by diabetes. A healthy diet, regular physical activity, maintaining a normal body weight and avoiding tobacco use are ways to prevent or delay the onset of type2 diabetes. The purpose of this study is to analyze the effect of Yogasanas on diabetes of Degree college men lecturers.

II. LIMITATIONS OF THE STUDY

The study was limited in the following way:
1. The psychological and mental balance of the subjects was not measured in the study.
2. The previous history of the subjects was not considered.
3. Regular activities pertaining to their day to day routine were not taken into account.
4. The researcher did not consider humidity, temperature and other environmental conditions.
5. The physical fitness level was not evaluated through physical fitness tests.

III. DELIMITATIONS OF THE STUDY

The study was delimited as follows:-
1. The study was conducted only to men lecturers working in Degree colleges of Narasarao pet.
2. The subjects were ranged in the age group of 35 to 50 years.
3. Only 40 men lecturers volunteer were selected and they were allotted to two groups by mean random blood sugar level.
4. The effect of yogasanas on diabetics was measured through physiological variables, systolic blood pressure and diastolic blood pressure, for this study.
5. The effect of yogasanas on diabetics was measured through biochemical variables, fasting blood sugar and postprandial sugar for this study.
6. The interventional programmes 12 weeks yogasanas for experimental group was considered as independent variables for this study.

IV. SELECTION OF SUBJECTS

To select degree college men lecturers of Narasarao pet on diabetics, the investigator administered a brief questionnaire among men lecturers on their health status and presence of diabetics. The questionnaire was administered among 100 Degree men lecturers. Based on the survey, men lecturers undergoing for diabetics treatment were identified. From such men lecturers, 40 subjects were randomly selected for this study. The age group of the subjects was between 35 to 50 years. They were preliminarily assessed of their blood sugar through standard tests and medical reports of them were verified. The selected subjects were assigned into two different groups based on their mean random blood sugar level. Equated groups design was used with thirty subjects in each group, namely control group, experimental group.

Dependent Variables
Biochemical Variables
1. Fasting Blood Sugar
2. Postprandial Blood Sugar
Physiological variables
1. Systolic Blood Pressure
2. Diastolic Blood Pressure

Independent Variables
1. Twelve Weeks Yogic Practices

V. EXPERIMENTAL DESIGN
Randomly selected forty men diabetic lecturers in the age group of 35 to 50 were grouped into two based on their mean random blood sugar level. Thus, equated groups design was used with twenty subjects in each group, namely control group, experimental group. Pre tests were conducted for all the subjects on selected physiological and biochemical variables such as systolic blood pressure, diastolic blood pressure, postprandial blood glucose and fasting blood sugar. This formed initial scores of the subjects. The experimental group underwent yogasanas for twelve weeks. After the experimental period, the post tests were conducted on the above said dependent variables which formed final scores of the subjects. The difference between initial and final scores was considered as the effect of respective treatment. To test statistical significance, ANCOVA was used. In all cases 0.05 level was fixed to test the hypothesis of this study.

CRITERION MEASURES
1. Systolic and diastolic blood pressures were measured through sphygmomanometer.
2. Biochemical variables postprandial blood glucose and fasting glucose were determined through blood samples analyzed through laboratory.

YOGASANAS
In order to give scientific yogic training to the subjects, the investigator selected asanas for warm up, asanas for practice, pranayama for breath holding and cleansing and savasana for relaxation.
Each session lasted for 50 minutes consisting of 5 minutes warm up in the form of loosening exercises, followed by ten asanas lasting for 30 minutes (10 x 3 minutes), 10 minutes pranayama and 5 minutes relaxation in the form of savasana.
Loosening exercises were given to the subjects as warm up, any ten of the following asanas Padmasana, Dhanurasana, Bhujangasana, Yoga Mudra, Paschimotanasana, Adhra Chakrasana, Ardha Pasasamuktasana, Vajrasana, Trikonasana, Padahastasana, Halasana, Salabasana, were given to the subjects as yogasana practices. Any two of the three pranayamas Nadi Sodhana Pranayama, Kapalabhathi Pranayama and Sheetali Pranayama were given to the subjects. As a relaxation asana, savasana was asked to be practiced for 10 minutes.

VI. RESULTS ON SYSTOLIC BLOOD PRESSURE
The initial and final means on experimental group and control group on Systolic Blood Pressure among Degree college men lecturers and the obtained results on Analysis of Covariance (ANCOVA) is presented in Table I.

Table F-ratio at 0.05 level of confidence for 1 and 58 (df) =4.01, 1 and 57(df) =4.01.
* Significant
The pre test mean on experimental group was 145.00, and control group was 146.00 and the obtained F value was 0.15, which was less than the required F value of 4.01 to be significant. Hence, it was not significant and the groups were equal at initial stage.
The comparison of post test means, experimental group 135.83 and control group 147.00 proved to be significant at 0.05 level as the obtained F value 37.61 was greater than the required table F value of 4.01 to be significant at 0.05 level.
Taking into consideration the initial and final mean values adjusted post test means were calculated and the obtained F value of 134.52 was greater than the required F value to be significant 4.01 and hence, there was significant difference. Thus, it was proved that experimental group gained mean difference on, Systolic Blood Pressure -9.17 was due to Yogic practices given to Degree college men lecturers, and the difference was found to be significant at 0.05 level.
The initial, post and adjusted means values of experimental and control group on Systolic Blood Pressure is presented in Figure I for better understanding of the results of this study.
DISCUSSIONS

The results presented in Table I proved that the Systolic Blood Pressure has not been significantly improved among control group as they do not underwent Yogic Practices. However, the twelve weeks Yogic practices given to the experimental group significantly improved Systolic Blood Pressure among diabetic Degree college men lecturers. The statistical mean difference between initial test and final test of experimental group stood at -9.17 and control group stood at 1.00. The adjusted mean taking into consideration of initial and final means on Systolic Blood Pressure among experimental group was 136.14 and control group was 146.69 and showed favorable effects on yogic practices group than control group. And the differences, statistically treated using ANCOVA, were found to be significant at 0.05 level as the obtained F value of 134.52 was greater than the required table F value of 4.01 to be significant at 0.05 level.

Thus, it was proved that Yogic practices was significantly better than control group in favorably influencing Systolic Blood Pressure thereby manage diabetics of the Degree college men lecturers.

Due to twelve weeks of yogic practices systolic blood pressure induced to alter systolic blood pressure significantly compared to control group. As the subjects began to do the physical exertion in the form of experimental treatment, there was increased blood circulation, which resulted in reduced pulse rate. With the additional aerobic power, the systolic pressure began to stabilize. Hence, there was reduction in systolic blood pressure.

RESULTS ON DIASTOLIC BLOOD PRESSURE

The initial and final means on experimental group and control group on Diastolic Blood Pressure among Degree college men lecturers and the obtained results on Analysis of Covariance (ANCOVA) is presented in Table II.

</table>

Table F-ratio at 0.05 level of confidence for 1 and 58 (df) =4.01, 1 and 57(df) =4.01 .

* Significant

The pre test mean on experimental group was 92.93, and control group was 93.67 and the obtained F value was 0.31, which was less than the required F value of 4.01 to be significant. Hence, it was not significant and the groups were equal at initial stage.

The comparison of post test means, experimental group 88.50 and control group 95.17 proved to be significant at 0.05 level as the obtained F value 46.49 was greater than the required table F value of 4.01 to be significant at 0.05 level.

Taking into consideration the initial and final mean values adjusted post test means were calculated and the obtained F value of 47.50 was greater than the required F value to be significant 4.01 and hence, there was significant difference.

Thus, it was proved that experimental group gained mean difference on, Diastolic Blood Pressure -4.43 was due to Yogic practices given to Degree college men lecturers, and the difference was found to be significant at 0.05 level.

Figure I
Bar Diagram Showing Initial, Final and Adjusted Means on Systolic Blood Pressure of Experimental and Control Groups
The initial, post and adjusted means values of experimental and control group on Diastolic Blood Pressure is presented in Figure II for better understanding of the results of this study.

**DISCUSSIONS**

The results presented in Table II proved that the Diastolic Blood Pressure has not been significantly improved among control group as they do not undergone Yogic Practices. However, the twelve weeks Yogic practices given to the experimental group significantly improved Diastolic Blood Pressure among diabetic Degree college men lecturers. The statistical mean difference between initial test and final test of experimental group stood at -4.43 and control group stood at 1.50. The adjusted mean taking into consideration of initial and final means on Diastolic Blood Pressure among experimental group was 88.58 and control group was 95.08 and showed favorable effects on yogic practices group than control group. And the differences, statistically treated using ANCOVA, were found to be significant at 0.05 level as the obtained F value of 47.50 was greater than the required table F value of 4.01 to be significant at 0.05 level.

Thus, it was proved that Yogic practices was significantly better than control group in favorably influencing Diastolic Blood Pressure thereby managing diabetics of the Degree college men lecturers.

**RESULTS ON FASTING SUGAR**

The initial and final means on experimental group and control group on Fasting Sugar among Degree college men lecturers and the obtained results on Analysis of Covariance (ANCOVA) is presented in Table III.

**Table III**

</table>

Table F-ratio at 0.05 level of confidence for 1 and 58 (df) =4.01, 1 and 57(df) =4.01.

* Significant

The pre test mean on experimental group was 227.80, and control group was 224.97 and the obtained F value was 1.75, which was less than the required F value of 4.01 to be significant. Hence, it was not significant and the groups were equal at initial stage.

The comparison of post test means, experimental group 219.80 and control group 224.47 proved to be significant at 0.05 level as the obtained F value 5.12 was greater than the required table F value of 4.01 to be significant at 0.05 level.

Taking into consideration the initial and final mean values adjusted post test means were calculated and the obtained F value of 558.78 was greater than the required F value to be significant 4.01 and hence, there was significant difference.

Thus, it was proved that experimental group gained mean difference on Post Parandial Sugar -8.00 was due to Yogic practices given to Degree college men lecturers, and the difference was found to be significant at 0.05 level. The initial, post and adjusted means values of experimental and control group on Post Parandial Sugar is presented in Figure IV for better understanding of the results of this study.
DISCUSSIONS

The results presented in Table IV proved that the Post Parandial Sugar has not been significantly improved among control group as they do not undergone Yogic Practices. However, the twelve weeks Yogic practices given to the experimental group significantly altered Post Parandial Sugar among diabetic Degree college men lecturers. The statistical mean difference between initial test and final test of experimental group stood at -8.00 and control group stood at -0.50. The adjusted mean taking into consideration of initial and final means on Post Parandial Sugar among experimental group was 218.45 and control group was 225.82 and showed favorable effects on yogic practices group than control group. And the differences, statistically treated using ANCOVA, were found to be significant at 0.05 level as the obtained F value of 558.78 was greater than the required table F value of 4.01 to be significant at 0.05 level.

Thus, it was proved that Yogic practices was significantly better than control group in favorably influencing post parandial Sugar in managing diabetics of the Degree college men lecturers.

VII. CONCLUSIONS

Within the limitations and delimitations of the study, the following conclusions were drawn.

1. The effect of selected yogasanas on diabetics among Degree college men lecturers was tested through physiological variable, systolic blood pressure and it was concluded that selected yogasanas beneficially altered systolic blood pressure and the reduction was statistically significant.

2. The effect of selected yogasanas on diabetics among Degree college men lecturers was tested through physiological variable, diastolic blood pressure and it was concluded that selected yogasanas beneficially altered diastolic blood pressure and the reduction was statistically significant.

3. The effect of selected yogasanas on diabetics among Degree college men lecturers was tested through biochemical variable, fasting sugar and it was concluded that selected yogasanas beneficially altered fasting sugar and the reduction was statistically significant.

4. The effect of selected yogasanas on diabetics among Degree college men lecturers was tested through biochemical variable, post prandial sugar and it was concluded that selected yogasanas beneficially altered post prandial sugar and the reduction was statistically significant.
