ABSTRACT

“HOSTEL MANAGEMENT SYSTEM” is software developed for managing various activities in the hostel. For the past few years the numbers of educational institutions are increasing rapidly. Thereby the number of hostels are also increasing for the accommodation of the students studying in this institution. And hence there is a lot of strain on the person who are running the hostel and softwares are not usually used in this context. This particular project deals with the problems on managing a hostel and avoid the problems which occur when carried manually. This project is expected to limit human works and make hostel allocation much easier for student and hostel administrators with the help of this software. In this way, the quantity of hostels is additionally expanding for the settlement of the student considering in this college. Identification of the drawbacks of the existing system leads to the designing of computerized system that will be compatible to the existing system with the system which more users friendly.

Keywords - HTML, CSS, JAVASCRIPT, PHP

I. INTRODUCTION

This system is designed in favor of the hostel management which helps them to save the records of the students about their rooms and other things. All these hostels at present are managed manually by the hostel office. The Registration form verification to the different data processing are done manually. Thus there are a lot of repetitions which can be easily avoided. And hence there is a lot of strain on the person who are running the hostel and software’s are not usually used in this context. This particular project deals with the problems on managing a hostel and avoids the problems which occur when carried manually. Identification of the drawbacks of the existing system leads to the designing of computerized system that will be compatible to the existing system with the system which more friendly. We can improve the efficiency of the system, thus overcome the drawbacks of the existing system.

II. STATUS OF CURRENT AVAILABLE SYSTEMS

The proposed application software manage the hostel management by improving their services for all the students of the hostel. It also reduce the manual work of the persons in Admin Panel and the bundle of registers that were to maintain and search to find the information of a previous student, because through this system you can store the data of those students who had left the hostel. The proposed system helps in checking the personal profile of all the current students within few minutes and the data base of the system will help you to check a particular one. Finally the proposed system.

- To automate each and every activity of the manual system which increases its throughput
- To provide a quick response with very accurate information as and when required
- To make the present manual system more interactive, speedy and user friendly
- To avail any information, whatever and whenever needed
- Reduce the cost of maintenance
Drawbacks of existing system:

- More human error
- More strength and strain of manual labor needed
- Repetition of same procedures
- Low security
- Data redundancy
- Difficult to handle
- Record keeping is difficult
- Backup data can be easily generated

III. USERS OF THE SYSTEM

1. Admin login
2. Student login

IV. PROPOSED SYSTEM

The drawback of the existing system is that it is very difficult to retrieve data from record. It is also difficult to handle the whole system manually and it is less accurate and to keep the data in records for future reference because it may get destroyed. Moreover, it is very difficult to retrieve data. Redundancy of data may occur and this may lead to this inconsistency. The manual system is so time-consuming. The proposed system is very easy to operate. Speed and accuracy are the main advantages of proposed system. There is no redundancy of data. The data are stored in the computer secondary memories like hard disk etc., it can be easily access and used at any time. The proposed system will easily handle all the data and the work done by the existing systems. The proposed system eliminate the drawbacks of the existing system to a great and it provides tight security to data.

Advantages in Proposed System:

- Less Human error
- Strength and strain of manual labor can be reduced
- High security
- Data redundancy can be avoided to some extent
- Easy data updating
- Easy recordkeeping
- Backup data can be easily generated
- Students can get their out pass when they leave the campus
- Students can register complaints regarding hostel and also upload attendance through website
- Students can get their food tokens
- Each students can get their own credits
V. IMPLEMENTATION

Fig 1: Use case
More About Hostel Mate

Hostel Mate is an user friendly application that allows hostels to manage the hostel environment with the help of mobile application.

- User Friendly
- Safe and Secure
- Easy to Use
- Your companion at Hostel

LEARN MORE ABOUT US

User Friendly

The user interface is built in such a way that it behaves friendly with the User.

Easy to Use

We've designed our app in such a way that it is convenient for the Users.

Safe and Secure

Every data you provide in this app will be safe and secure with our back-end.

Your Companion at Hostel

Hostel Mate acts a Companion for you in your Hostel.
VI. CONCLUSION

The development of the hostel management system is a user friendly system to indents to automate the hostel from manual system. It’s a computer based system that will manage all the operations of the hostel. The project development using PHP and JavaScript is based on the requirement specification of the user and the analysis of the existing system, with flexibility for future enhancement. The expanded functionality of today’s software requires an appropriate approach towards software development. This hostel management software is designed for people who want to manage various activities in the hostel for the past few years the numbers of educational institutions are increasing rapidly. Thereby the numbers of hostels are also increasing for the accommodation of the students studying in this institution. And hence there is a lot of strain on the person who are running the hostel and software’s are not usually used in this context. This particular project deals with the problems on managing a hostel and avoids the problems which occur when carried manually. Identification of the drawbacks of the existing system leads to the designing of computerized system that will be compatible to the existing system with the system which is more user friendly and more GUI oriented.
