The Short Review on Bone Implants Based on Copper

Arvind Kumar Jain, Professor, Department of Basic Sciences, Galgotias University

Abstract

Bone implants based on copper are common. Copper was used for diversified bone implants including knee implants, hip implants, etc. This review paper is the consolidation of research trends related to copper-based bone implants, visualized through review analysis. The active authors, organizations, journals, and countries involved in the research “copper-based boneimplants” were highlighted in this review. The leading Journals were Biomaterials. The most active country was China. The leading organization engaged in research regarding copper-based bone implants was the Chinese Academy of Sciences, China. The most active author who had made valuable contributions related to copper-based bone implants was Yang K.

Keywords: Copper, Bone-implants, Reviews, Material engineering, Review analysis, Meta Analysis

1. Introduction

Bone implants were one of the popular types of bio-implants (Baier and DePalma, 1985). The popular type of bone implants includes knee implants and hip implants. Copper is also used for dental bones. Copper is also used for preparing screws and for surface coating of bones and implants based on other metals like Titanium and various alloys (Prantl et al., 2010) (Rosenfeld, Williams, and Sharma, 1981). Copper coating on bone implants had found very effective for bone regeneration and bone-forming activities.

Copper-based bone implants and copper coated implants had wide acceptance due to the anti-bacterial properties and infection resistance. There are scientific proofs for the antibacterial properties and infection resistance of copper (Schlosser et al., 2011) (Chai et al., 2011) (Gosau et al., 2013) (Habibovic et al., 2008; Gosau et al., 2010).

The major concerns regarding copper implants are due to metal discharge, which can even lead to failure of the implant (Kręcisz, Kiec-Świerczyńska, and Chomiczewska-Skóra, 2012). Corrosion, allergy or hypersensitivity of copper, and toxicity of copper are also the issue to be addressed about copper implants (Hallab et al., 2008) Both material engineering and surface engineering have great scope in improving the performance and life of copper-based bone implants.

This review paper contains four sections. The introduction of copper implants with special focus on the special features and peculiarities of copper implants was explained in the first section, followed by the discussion of the research methodology of this paper. The results and discussions related to copper-based bone implants are included in the third section of this paper. The fourth section deals with the conclusion. The following research objectives and research questions were framed for conducting review analysis systematically.

1.1 Research Objectives

a) To consolidate the scientific papers on the research regarding the copper-based bone implants
b) To find out the trends related to research in copper-based bone implants
1.2 Research Questions

a) Who are the active researchers working on copper-based bone implants?
b) Which are the main research organizations and countries working on copper-based bone implants?
c) Which are the leading journals publishing scientific papers on the copper-based bone implants?

2. Research Methodology

Scopus files had been used for this article. For the article selection, the Boolean used was TITLE-ABS (Copperbone implant). All the tables in this paper were created by using Microsoft Excel and Meta Analysis. Grammarly was used for spelling and grammar checks. Mendeley was used for article review and citation. This paper had been inspired by review analysis in its presentation style, analysis, and methodology from the works.

3. Results and Discussion

3.1 Results

The first search on Scopus had obtained 123 documents, in three languages, out of which 118 documents were in English. The document categories were classified and shown in Table 1. This review had selected only the peer-reviewed articles and all other documents had not been considered. Thus after using filters “Article” and “English” the second round search produced an outcome of 91 English articles (both open access and others) and had been used to conduct review analysis and visualization using Meta Analysis. The English research articles in this domain since 1975 had been shown in Table1. Co-authorship analysis of top authors had been shown in Table1. For a better presentation of the analysis, the parameters used were the minimum number of documents of an author as three and the minimum number of citations of authors as one. This combination plotted the map of 16 authors, in six clusters. The overlay visualization map of co-authorship analysis plotted in Table1, points out the major researchers with their strong co-authorship linkages and clusters involved. The citation analysis of top authors had been shown in Table 1. For the citation analysis, the parameters used were the minimum number of documents of an author as two and the minimum citations of an author as one.

<td>43.4</td>
<td>32</td>
</tr>
</tbody>
</table>

In Co-occurrence analysis, we had used all keyword analyses, by keeping the minimum number of occurrences of a keyword as 12. This combination plotted the map of 29 thresholds, in three clusters. The overlay visualization of co-occurrence analysis of keywords has been shown in Table 2. The leading organizations engaged in research on “copper-based bone implants” had been found out by the volume of publications and citation analysis, the parameters used are the minimum number of documents of an organization as one and the minimum number of citations of organizations as one. The leading organization in the research regarding “copper-based bone implants”, with the highest number of publications and citations, was the Chinese Academy of Sciences, China (Refer to table 2).

<td>39</td>
</tr>
</tbody>
</table>

Co-authorship analysis of the countries engaged in the research on “copper-based bone implants” had been shown in Table 3. The overlay visualization map of co-authorship analysis plotted in Table 3, points out the main countries with their strong co-authorship linkages and clusters involved. The citation analysis of top countries had been shown in table 3, along with co-authorship links. For the citation analysis, the parameters used were the minimum number of documents of a country as one and the minimum citations of the country as one.

Table 3: Highlights of Active Countries

<table>
<thead>
<tr>
<th>Description</th>
<th>Country</th>
<th>Documents</th>
<th>Citations</th>

<td>728</td>
<td>15</td>
</tr>
</tbody>
</table>

The most active country in this research domain was China, with the position in publications, links, and citations.

The most active journals engaged in the research were identified through analyzing co-authorship links and citation analysis. Highlights of the most active and relevant journals related to “copper-based bone implants” are shown in table 4. Table 4 shows the journal activity of this research domain through parameters of publication volume and citations.

Table 4: Analysis of journal activity

<table>

</table>

From the above discussion regarding the review patterns in the research regarding copper-based bone implants, this research had observed a gradual increase in research interest regarding copper-based bio-implants from the starting of the millennium, and the momentum is going on positively. This points out the relevance and potential of this research domain (Refer to Table 2). The most active author in this research domain was Yang K. with the highest publication, links, and citations (Refer to table 1). The overlay analysis of top countries researching copper implants indicates that China was the leading country relating to the highest number of publications and citations (Refer to Table 5). The top journals of this research domain were identified as the Biomaterials. From these wide sources of information, researchers can focus on top journals where they can identify the most relevant and highly cited articles regarding Copper-based bone implants.
4. Conclusion

Copper-based bone implants have great scope for future research and the most active journals related to this research domain were the Biomaterials. The leading organization engaged in research regarding copper-based bone implants was the Chinese Academy of Sciences, China. The most active author who had made valuable contributions related to copper-based bone implants was Yang K. This research domain offers a new avenue for researchers and future research can be on innovations in copper-based bone implants.
